```
Commands:
---------

postfix start   start the damn thing
postfix stop    stop the whole ambaradam
postfix reload  for changes to take effect

Places:
-------

/etc/postfix          configuration files
/usr/libexec/postfix  daemons
/usr/sbin             commands
/var/log/maillog      logs
/var/spool/postfix    queue files

/var/log/mail.err     errors (activities blocked)
/var/log/mail.warn    warnings (actvities continue)
/var/log/mail.info    general activities
/var/log/mail.log

main.cf configuration
---------------------

myhostname      Postfix system host name
mydomain        local domain name
myorigin        mail address in the from: field
mynetworks      remote trusted clients
mydestination   list of addresses Postfix is authorized to receive mail for

use SMTP authentication
use SASL protocol for SMTP authentication

Sendmail header fields:
-----------------------

address: implicit at first line after flags;
subject: next line after address;
content: next line after subject;
. (dot): end of message.

Canonical domains (domain of the machine Postfix runs on)
-----------------

hostname: tecnorma;
IP addr: 192.168.2.74.

there are not hosted (other than tecnorma) nor relay (domains on other machines) dom
ains on this machine.

This machine receives mail only for itself, as specified by directive mydestination;
this machine receives mail only for addresses specified in /etc/postfix/virtual, and
 delivers them to accounts specified therein;
accounts are created under /home, and each account is composed of several subfolders
.

Mail clients on PCs connect to these accounts and see folders structure therein.
